## Description

A user can book a reservation for either a saloon or a specific number of tables (at least one). When reserving a saloon, all tables within it are automatically part of the same reservation. It is possible for a user to add details of an event for which a saloon is reserved.

A user is either an employee or a customer, and both can create an order for a table. However, only employees can manage confirmed orders and reservations. Since this system only supports indoor orders, a table is required to place an order.

Every order must include at least one menu item, with an optional note for modifications (unreasonable modifications can be disregarded and aren't a concern to the system). Each menu item consists of one or more ingredients. Employees are responsible for taking ingredients from storage and must log the time and quantity of ingredients taken.
